DATA GERRY

FACT SHEET

The intelligent, flexible open-source solution
for CMDB and ISMS

YOUR IT IS DRIVING YOU NUTS?
Automate your IT with DataGerry

From small and medium-sized businesses to large corporations: Document your IT and compliance assets in a service-oriented and flexible way, tailored to your specific needs.

With DataGerry, you're not limited to using our templates or a predefined data schema; instead, you can create your own data model with a high degree of flexibility. In addition, we offer connectors to more than 100 applications via an integrated API integration platform. We are 100% open source, available both as a self-hosted solution and in the cloud.

Key strengths

- Service-oriented modeling capabilities
- Flexible data structure, expandable at any time
- Modern API-driven user interface
- Document generator
- Application-specific templates
- Guided quick-start wizard
- Integrated GRC (ISO 27001 & NIS2)
- Platform for API integrations (NetBox, Wazuh, etc.)
- EU-hosted cloud or self-hosted implementation options

Features

- Flexible Data Model & Object Management
- API, Webhooks & Automation
- CI Explorer & Dependency Visualization
- ISMS & Integrated Risk Analysis
- Reporting & Import/Export
- Open Source & Extensibility
- Scalability & Multi-Tenancy

ARE YOU NIS2-READY?
ACT NOW!

Our NIS2 checklist for implementing the new EU requirements provides you with a concise overview of all obligations. We recommend DataGerry as a comprehensive solution for efficient NIS2 compliance.

ISMS Based on CMDB Data – Practical Implementation of ISO 27001 and NIS2

DataGerry combines comprehensive asset and service documentation with integrated risk and action processes. This means that risks are not merely "theoretical" but are directly linked to services, systems, and dependencies—including reports and audit evidence.

DataGerry creates a centralized, consistent database and ensures transparency across all relevant assets and their relationships. This enables the structured implementation of requirements from ISO 27001 and NIS2, the assessment of risks, and the efficient management of measures. At the same time, it facilitates audit-proof documentation, simplifies audits, and strengthens information security in the long term.
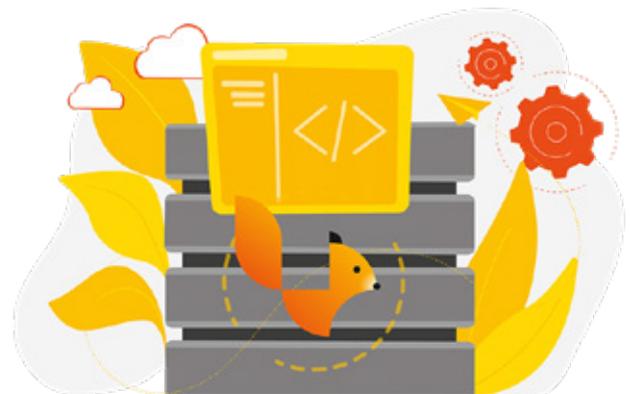

DataGerry Cloud

Like the self-hosted version, the cloud version of DataGerry is based entirely on our freely available open-source code. The key difference: With the cloud version, you benefit from a ready-to-use, professionally managed platform. DataGerry offers you a convenient and scalable solution for the efficient management of your IT and business resources. You don't have to worry about servers, installation, updates, security, or operations. All new features and improvements are immediately available in the cloud version.

With the cloud version, you can securely access your data from any location—ideal for companies with distributed teams or multiple locations. The reliable cloud environment ensures high availability, rapid implementation, and a significant reduction in technical effort.

DataGerry Self-Hosted

The self-hosted version of DataGerry offers a flexible, self-managed solution for companies that want to retain full control over their IT infrastructure and data. The self-hosted version is based on freely available open-source code. By installing it on-premises, you retain data sovereignty and can configure your environment to meet internal security and compliance standards. This version is particularly suitable for companies that require a high degree of adaptability and wish to integrate or expand their systems individually. Support is provided by the open-source community, which offers valuable assistance through a wealth of resources and active collaboration. Our team is also happy to assist you with installation, support, and operation.
